

Chapter 1 - Introduction

1.1 Introduction

Customer support plays a vital role in maintaining customer satisfaction and building long-term relationships. As organizations receive an increasing number of service requests, manual case management becomes time-consuming and prone to delays. Modern businesses require intelligent systems that can automate repetitive tasks, improve response times, and provide consistent support experiences.

Salesforce is one of the world's leading Customer Relationship Management (CRM) platforms, offering powerful automation capabilities through features such as Flows, Validation Rules, Queues, Lightning App Builder, Prompt Builder, and Agentforce. By integrating Artificial Intelligence into customer service processes, organizations can improve operational efficiency while reducing manual effort.

The AI-Powered Customer Support & Service Automation project is developed using Salesforce to automate customer support operations. The system manages customer information, products, orders, and customer service cases through custom Salesforce objects. It automates case assignment using Record-Triggered Flows, validates user input using Validation Rules, and generates AI-assisted case summaries using Salesforce Prompt Builder. The project demonstrates how Salesforce AI capabilities can simplify customer support workflows, improve data accuracy, enhance productivity, and provide a scalable solution for modern customer service management.

The image shows the Salesforce India's #1 Agentic CRM landing page. The top navigation bar includes the Salesforce logo, links for Products, Industries, Customers, Events, Learning, and More, a search bar with the text "Ask Agentforce any...", a "Contact Us" link with the phone number 1800-420-7332, and a "Get started" button. The main hero section has a blue background with the text "Get Started with Salesforce - India's #1 Agentic CRM." and a sub-headline "Automate better sales, service, and marketing with humans and AI agents working together on one trusted, agentic CRM platform. See value from day one with quick and easy setup and pre-built agents." Below this are two buttons: "Start for free" and "Watch demo". The bottom section is titled "Become an Agentic Enterprise" with the tagline "Where humans, agents, and platforms drive customer success together." and features five icons representing different Salesforce products: Slack, Tableau, Agentforce, Customer 360, and Data 360, each with a brief description of how they integrate with the agentic CRM platform.

Get Started with Salesforce - India's #1 Agentic CRM.

Automate better sales, service, and marketing with humans and AI agents working together on one trusted, agentic CRM platform. See value from day one with quick and easy setup and pre-built agents.

Become an Agentic Enterprise

Where humans, agents, and platforms drive customer success together.

- Slack**
Connect workflows and conversational data where work happens.
- Tableau**
Turn agentic analytics into actionable intelligence.
- Agentforce**
Build trusted, agentic experiences that act with purpose.
- Customer 360**
Ground every decision in proven business context.
- Data 360**
One governed, trusted data foundation.

1.2 Problem Statement

Many organizations continue to manage customer support requests manually, resulting in delayed responses, inconsistent documentation, incorrect case assignments, and increased workload for support teams. Manual processes also make it difficult to maintain data consistency and provide timely assistance to customers. The lack of intelligent automation limits productivity and increases operational costs.

Therefore, there is a need for a centralized customer support solution that automates case management, validates user input, intelligently routes cases, and assists support agents using Artificial Intelligence.

1.3 Objectives

- Develop a customer support management system using Salesforce.
- Automate customer case creation and management.
- Implement validation rules to ensure data accuracy.
- Automate case assignment using Flows.
- Generate AI-powered summaries using Prompt Builder.
- Provide secure and role-based access to the system.
- Improve overall efficiency of customer support operations.

1.4 Scope of the Project

The project focuses on developing an AI-enabled customer support application within Salesforce. It includes the creation of custom objects for Customer, Product, Order, and Case (Use Case) management. The application automates customer support processes through validation rules, flows, queues, and AI-generated summaries, while ensuring secure access and data integrity throughout the system.

1.5 Expected Outcomes

- Automated customer support management.
- Reduced manual intervention in case handling.
- Improved data accuracy and consistency.
- Automatic case/queue assignment.
- AI-assisted case summaries for faster resolution.
- Improved overall customer satisfaction.
