

Chapter 7 - Maintenance, Monitoring & Troubleshooting

7.1 Introduction

After deployment, regular maintenance and monitoring are essential to ensure the long-term stability and performance of the application. Salesforce provides administrative tools that enable continuous monitoring, troubleshooting, and system optimization.

The AI-Powered Customer Support & Service Automation application was designed to support future maintenance while minimizing operational issues through Salesforce automation and built-in monitoring capabilities.

7.2 Maintenance Activities

Regular maintenance activities include:

- Reviewing validation rules.
- Monitoring automation flows.
- Updating Prompt Builder templates.
- Managing support queues.
- Adding new products and customers.
- Updating security permissions.
- Applying Salesforce platform updates.

7.3 Monitoring

The following components should be monitored regularly:

- Flow execution logs.
- Queue assignment accuracy.
- AI Summary generation.
- User login activity.
- Validation Rule failures.
- Record creation statistics.
- Reports and dashboards.

7.4 Troubleshooting

Common issues and their solutions are summarized below.

Issue	Possible Cause	Solution
Flow not executing	Flow inactive	Activate Flow
Queue assignment failed	Incorrect Queue ID	Update Queue ID
Validation Rule not triggered	Incorrect formula	Review validation logic
AI Summary missing	Prompt Builder inactive	Activate Prompt Template
Lookup error	Related record missing	Create required record

7.5 Future Maintenance

Future maintenance may include:

- Additional AI capabilities.
- Email notifications.
- Chatbot integration.
- Mobile application support.
- Advanced analytics dashboards.
- External CRM integrations.

7.6 Chapter Summary

Continuous maintenance and monitoring ensure that the application remains reliable, secure, and scalable. Salesforce administrative tools simplify troubleshooting and enable efficient long-term system management.
